*Problem 13.42: To determine if a graph G with 50 vertices is 3-colorable, you test all possible 3-colorings. Your computer checks a million 3-colorings per second. Estimate how long it is going to take, in the worst case.

Test all 50 vertices with 3 colors:

By sum and product law, we know that the number of subsequent choices aren't affected by the previous, we can conclude that each vertices will have 3 possible choices. All possible 3-colorings are calculated by 3^{50}

Given that the computer checks a million 3-colorings per second, we can calculate:

$$T = \frac{3^{50}}{10^7}$$
$$\approx 7.179 \times 10^{16}$$

This means that all possible 3 colorings can be calculated in about $\boxed{\mathbf{7.179 \times 10^{16}}}$ seconds.

*Problem 13.50. How many 7-digit phone-numbers are non-decreasing (each digit is not less than the previous one.)

For 10 total numbers,

*Problem 14.15(b-c). Consider the binary strings consisting of 10 bits.

(a) **How many contain (i) 5 or more consecutive 1's (ii) 5 or more consecutive 0's?**

   (i) 5 or more consecutive 1's

      For a string of 5 bits, we have 6 possible start locations to begin placing 1's to make sure that we reach 5 consecutive 1's. For all 6, you can only choose 1 number $= 1$. For the remaining 4 options, we can choose 2 numbers.

      There are $\mathbf{6 \times 2^4}$ possible binary strings consisting of 10 bits that contain 5 or more consecutive 1's.

  (ii) 5 or more consecutive 0's

      following the same logic, we can deduct this is the same, at $\mathbf{6 \times 2^4}$ possible binary strings.

(b) **How many contain 5 or more consecutive 0's or 5 or more consecutive 1's?**

    For every binary string that have 5 or more consecutive 1's, just replace those with 0's to achieve $\boxed{\mathbf{2 \times 6 \times 2^4}}$ possibilities.

*Problem 14.34. Consider all permutations of $\{1, 2, 3, 4, 5, 6\}$. A permutation is good if any of the sub-sequences 12, 23, or 56 appear. How many good permutations are

there?

Let us create subsets like such:

```
1. {{1, 2}, 3, 4, 5, 6} subsequence 1,2 appear
2. {1, {2, 3}, 4, 5, 6} subsequence 2,3 appear
3. {1, 2, 3, 4, {5, 6}} subsequence 5,6 appear
4. {{1, 2, 3}, 4, 5, 6} subsequence 1,2 and 2,3 appear
5. {{1, 2}, 3, 4, {5, 6}} subsequence 1,2 and 5,6 appear
6. {1, {2, 3}, 4, {5, 6}} subsequence 2,3 and 5,6 appear
7. {{1, 2, 3}, 4, {5, 6}} all subsequence appear
```

1-3: Total number of subsequences that appears, with duplicated $= 3 \times 5!$

4-6: Number that 2 sequences appear $= 4!$, total of $3 \times 4!$

7: Number that all sequences appear $= 3!$

We can get rid of subset 4-6 by subtracting, but for subset 7, since all sequences appear, we have to remove it from 2 subsets:

$$3 \times 5! - 3 \times 4! - 2 \times 3! = 276$$

There are $\boxed{\mathbf{276}}$ possible permutations that contains 12, 23, or 56.

*Problem 14.63(g). Here are some counting problems on graphs to challenge you.

(g) **How many Hamiltonian cycles are in $K_{n,n}$? [Hint: a Hamiltonian cycle is a cycle on graph $G = (V, E)$ that starts and ends at vertex $v_0 \, \epsilon \, V$, visiting each vertex in set $V - \{v_0\}$ (i.e., all other vertices) exactly once.]**

*Problem 15.12. Roll a 6-sided die 5 times. What is the probability: (a) some number repeats (b) you get no sixes?

(a) some number repeats

Total number of combinations when rolling a die 5 times $= 6^5$

A die is rolled 5 times, for a number to repeat, you need two rolls to be the same number, we can choose any of the 6 numbers to be that number that repeats $= (1 \times 1) \times 6$

For the rest of the 3 numbers, we have 6 possibilities of what they can be $= 6^3$

Multiplied together, we get $(1 \times 1) \times 6 \times 6^3 = 6^4$

Probabilities of rolling a 6 sided die 5 times and ending with a repeated number $= \boxed{\dfrac{\mathbf{6^4}}{\mathbf{6^5}}}$

(b) no sixes

Total number of combinations stay the same at 6^5

6 is eliminated, only 5 possible numbers are left to choose from $= 5^4$

Probabilities of rolling a 6 sided die 5 times and ending with a repeated number and having

no 6's $= \boxed{\dfrac{5^4}{6^5}}$

*Problem 24.11(f,h,w). Give DFAs for the following languages, a.k.a., computing problems.

(f) $\mathcal{L} = \{1^{\bullet 2n}01^{\bullet 2k+1} \mid n, k \geq 0\}$.

(h) **Strings which begin with 10 and end with 01.**

(w) **Strings whose length is divisible by 3.**

*Problem 25.7 Give a DFA and a CFG for each problem.

(a) $\mathcal{L} = \{01^{\bullet n} \mid n \geq 0\}$

(b) $\mathcal{L} = \{0^{\bullet n}1^{\bullet n} \mid 0 \leq n \leq 5\}$

(c) $\mathcal{L} = \{$ strings which end in a 1 $\}$
